Test Task in Go

Hi!

You have **1 hour** to solve the task. If you are lucky enough and have time left, please try to optimise your solution or highlight some edge cases.

Build a middleware using echo framework

First of all, you should create a handler which sends how many **days** left **until 1 Jan 2025** and response with HTTP **200 OK** status code.

Secondly, build a middleware, which checks HTTP header `User-Role` presents and contains `admin` and prints `"red button user detected"` to the console (using default log package or any 3rd party) if so.

Think about coding standards and best practices. In general, the task is about providing a working solution, but if you have time to create a good code-structure, we'd love it!

Humanity's future is safe under our umbrella
